|-------------------|---------------|---|--------------------------------------|--|-----|--|
| ORbc;0 | ORbc | Amphibolite of Briggs Creek (Mesozoic or Paleozoic) | Paleozoic or Mesozoic | Informally called the "Briggs Creek amphibolite" by Garcia (1976) and by Coleman and others (1976). Consists of amphibolite, micaceous quartzite, quartz schist, and recrystallized manganiferous chert. Includes structurally complex amphibole schist and qu | 1 | |
| ORcm;0 | ORcm | Condrey Mountain Schist (Triassic? and Paleozoic?) | Paleozoic(?) to Jurassic | Consists of a variety of schistose rocks characterized by different proportions of muscovite, quartz, graphite, chlorite, actinolite, and epidote, rare thin layers of metachert, and clinozoisite-actinolite-albite-garnet metagabbro. Potassium-argon age on | 2 | |
| ORcs;0 ORice;0 | ORcs ORice | Colebrooke Schist (Mesozoic or Paleozoic) | Paleozoic or Mesozoic Holocene | Metamorphosed pelitic sedimentary rocks and subordinate metamorphosed submarine pillow lavas and pyroclastic beds of basaltic composition. Metamorphic age is Early Cretaceous (about 130 Ma), according to Coleman (1972), and protolith may be Jurassic or o | 2 | |
| ORJc;0 | ORJc | Chetco complex of Hotz (1971) (Jurassic) | Late Jurassic | Informally named unit representing island-arc volcanic complex comprised predominantly of igneous and metamorphosed volcanic rocks; includes gabbro, metagabbro, quartz diorite, and amphibolite | 1 | |
| ORJm;0 | ORJm | Melange (Jurassic) | Jurassic | Structurally complex mixture of basaltic rocks, serpentinite, chert, argillite, conglomerate, silty sandstone, and lenses of marble composing the melange of the Takilma area of Smith and others (1982) | 2 | |
| ORJop;0 | ORJop | Otter Point Formation of Dott (1971) and related rocks (Upper Jurassic) | Late Jurassic | Highly sheared graywacke, mudstone, siltstone, and shale with lenses and pods of sheared greenstone, limestone, chert, blueschist, and serpentine. Identified as melange by some investigators | 3 | |
| ORJs1;0 | ORJs1 | Sedimentary rocks (Jurassic) | Late Jurassic | Black and gray mudstone, shale, siltstone, graywacke, andesitic to dacitic water-laid tuff, porcelaneous tuff, and minor interlayers and lenses of limestone and finegrained sediments metamorphosed to phyllite or slate. Locally includes some felsite, and | 3 | |
| ORJs2;0 | ORJs2 | Sedimentary rocks (Jurassic) | Jurassic | Black and gray mudstone, shale, siltstone, graywacke, andesitic to dacitic water-laid tuff, porcelaneous tuff, and minor interlayers and lenses of limestone and finegrained sediments metamorphosed to phyllite or slate. Locally includes some felsite, and | 3 | Group (ORUZ8) Snowsnoe Formation (OR070) Shaw Member of Snowshoe Formation (OR028) Keller Creek Shale (OR008) Weberg Formation (OR070) Warm Springs Formation (OR070) Towbridge Formation (OR070) Lonesome Formation (OR070) |
| ORJss;0 | ORJss | Shale, mudstone, and sandstone (Jurassic) | Late Jurassic | Black to gray shale, mudstone, and sandstone with local lenses of pebble conglomerate. Overlies Josephine ophiolite of Harper (1980) (unit Ju) | 3 | |
| ORJTRad1:0 | ORJTRgd1 | Granite and diorite (Jurassic and Triassic) | Triassic and Jurassic | Felsic to intermediate, granitoid intrusive rocks. Includes Jurassic muscovite granodiorite, hornblende gabbro, tonalite, and quartz diorite of southwest Oregon (Smith and others, 1982) | 1 | |

| | | One its and the the Change is and | T-11-1- | Felsic to intermediate, granitoid intrusive rocks. Includes Jurassic muscovite granodiorite, homblende gabbro, | | Oxbow Complex (OR104; |
|------------|----------|---|---|--|---|--|
| ORJTRgd2;0 | ORJTRgd2 | Granite and diorite (Jurassic and Triassic) | Triassic to Jurassic | tonalite, and quartz diorite of southwest Oregon (Smith and others, 1982) | 1 | OR105)Canyon Mountain Complex (OR008; OR078) |
| - | ORJTRs | Sedimentary rocks (Jurassic and Upper Triassic) | Triassic to Jurassic | Black, dark-gray, and dark -brownish-gray, thin-bedded siliceous or limy mudstone mostly consists of the Hurwal Formation in the Wallowa Mountains. In lower and middle parts contains Triassic fossils and in upper part Early Jurassic fossils (Nolf, 1966). | | Hurwal Formation (OR074) |
| ORJTRsv;0 | ORJTRsv | Sedimentary and volcanic rocks (Jurassic and Upper Triassic?) | Late Triassic? to | Olive-drab, pale-brown, dark-gray, and black volcanic graywacke and siltstone; lesser conglomerate and slate, and minor limestone and chert. Includes more extensive outcrops of Triassic or Jurassic limestone at north base of Juniper Mountain in northern | 3 | Weatherby Formation (OR186) |
| ORJu;0 | ORJu | Ultramafic and related rocks of ophiolite sequences (Jurassic) | Paleozoic(?), Triassic(?), and Jurassic | Predominantly harzburgite and dunite with both cumulate and tectonite fabrics. Locally altered to serpentinite. Includes gabbroic rocks and sheeted diabasic dike complexes. Comprises Josephine ophiolite of Harper (1980), ophiolites of Onion Mountain, Sex | 2 | |
| ORJub;0 | ORJub | Ultramafic and related rocks of ophiolite sequences; Basaltic volcanic and sedimentary rocks (Jurassic) | Jurassic | Basalt flows, flow breccia, agglomerate, pillow basalt and pillow breccia, and lesser shale, chert, siltstone, and mudstone of ophiolitic complexes | 2 | |
| ORJv:0 | ORJv | Volcanic rocks (Jurassic) | Late Jurassic | Lava flows, flow breccia, and agglomerate dominantly of plagioclase, pyroxene, and hornblende porphyritic and aphyric andesite. Includes flow rocks that range in composition from basalt to rhyolite as well as some interlayered tuff and tuffaceous sedimen | 1 | |
| | ORKc | Clastic sedimentary rocks (Upper and Lower Cretaceous) | | Locally fossiliferous sandstone and conglomerate; marine fossils indicate Early Cretaceous (Albian) age (Jones, 1960). Includes the Hornbrook Formation of Peck and others (1956), the Grove Creek strata of Jones (1960) and Page and others (1977), Hunters | | Houstenaden Creek Formation |
| ORKJds1;0 | ORKJds1 | Sedimentary rocks of Dothan Formation and related rocks (Lower Cretaceous and Upper Jurassic) | Late Jurassic to Early Cretaceous | Sandstone, conglomerate, graywacke, rhythmically banded chert lenses. Includes western Dothan and Otter Point Formations of M.C. Blake, Jr. and AS. Jayko (unpublished data, 1985) in Curry and southern Coos Counties | 3 | |
| ORKJds2;0 | ORKJds2 | Sedimentary rocks of Dothan Formation and related rocks (Lower Cretaceous and Upper Jurassic) | Late Jurassic to | Sandstone, conglomerate, graywacke, rhythmically banded chert lenses. Includes western Dothan and Otter Point Formations of M.C. Blake, Jr. and AS. Jayko (unpublished data, 1985) in Curry and southern Coos Counties | 3 | |
| ORKJdv;0 | ORKJdv | Volcanic rocks of the Dothan Formation and related rocks (Lower Cretaceous and Upper Jurassic) | Late Jurassic to Early Cretaceous | Basaltic pillow lavas, volcanic breccia, and silicified basalt lava flows | 1 | |

| ORKJg;0 | ORKJg | Granitic rocks (Cretaceous and Jurassic) | Late Jurassic and Early Cretaceous | Mostly tonalite and quartz diorite but including lesser amounts of other granitoid rocks. Potassium-argon ages determined on hornblende indicates plutons range in age from 143 to 166 Ma (Hotz, 1971) | 1 | |
|----------|--------|--|--|--|---|--|
| ORKJgu;0 | ORKJgu | Gabbro and ultramafic rocks associated with granitic plutons (Cretaceous and Jurassic) | Late Jurassic and Early Cretaceous | Predominantly hornblende gabbro, gabbro, and olivine gabbro, but includes pyroxenite, hornblende pyroxene, and minor peridotite, dunite, and serpentinite (Smith and others, 1982) | 1 | |
| ORKJi;0 | ORKJi | Intrusive rocks (Cretaceous and Jurassic) | Jurassic to Cretaceous | Hornblende and biotite quartz diorite (tonalite), trondhjemite, granodiorite, and small amounts of norite, in batholithic masses and large dikelike bodies. Includes Bald Mountain Tonalite and Anthony Lake Granodiorite of Taubeneck (1957), tonalite and tr | 1 | |
| ORKJm;0 | ORKJm | Myrtle Group (Lower Cretaceous and Upper Jurassic) | Late Jurassic to Early Cretaceous | Conglomerate, sandstone, siltstone, and limestone. Locally fossiliferous. As shown, includes Riddle and Days Creek Formations (Imlay and others, 1959; Jones, 1969) | 3 | |
| ORKs;0 | ORKs | Sedimentary rocks (Cretaceous) | Cretaceous | Marine graywacke, subgraywacke, conglomerate, and shale. Pebbles and cobbles in conglomerate are well rounded volcanic and metavolcanic rocks, low-grade metasedimentary rocks, quartzite, chert, and minor silicic and intermediate plutonic rocks. Shales | 3 | Hudspeth Formation (OR049)Gable Creek Formation (OR049)Bernard Formation (OR028) |
| | | | | · | | |
| ORmc;0 | ORmc | May Creek Schist (Paleozoic) | Paleozoic(?) to Jurassic | Layered amphibolite, schist, gneiss, and quartzite. Protolith considered to be of Paleozoic age | 1 | |
| ORmr;0 | ORmr | Mixed rocks (Mesozoic and Paleozoic) | Paleozoic to Mesozoic | Intermingled, commonly highly sheared metasedimentary, metavolcanic, and igneous rocks. Includes serpentinite, altered gabbro, chert, siliceous phyllite, greenstone, and limestone | 2 | |
| ORPsv:0 | ORPsv | Sedimentary and volcanic rocks, partly metamorphosed (Permian and Permian?) | Permian | Epiclastic and volcaniclastic rocks, chert, limestone, and lava flows of mid- or Early Permian(?) age that are moderately to intensely metamorphosed. Includes part of Hunsaker Creek Formation of Vallier (1977), in the eastern Blue Mountains province, com | 2 | Hunsaker Creek Formation (OR075) |
| ORPZs;0 | ORPZs | Sedimentary rocks, partly metamorphosed (Paleozoic) | Paleozoic | Well-bedded limestone, fossiliferous cherty limestone, calcareous and carbonaceous sandstone, chert grit, argillite, and some conglomerate. In places foliated and metamorphosed. Includes fault slivers of Devonian rocks (Kleweno and Jeffords, 1961), Coffe | 2 | Coffee Creek Formation (OR085; OR091)Spotted Ridge Formation |
| ORPZsv;0 | ORPZsv | Sedimentary and volcanic rocks, partly metamorphosed (Paleozoic |) Paleozoic | Undifferentiated sedimentary and volcanic rocks some of which are highly deformed and locally metamorphosed to amphibolite and schist. Occurs mostly in Strawberry and Aldrich Mountains of the Blue Mountains province. Includes undivided Paleozoic rocks an | 2 | Dixie Butte Meta-andesite |
| ORQa;0 | ORQa | Andesite (Holocene and Pleistocene) | Quaternary | Forms major stratovolcanoes dominantly of aphyric to porphyritic basaltic andesite and andesite; phenocrysts are principally pyroxene, olivine, plagioclase, and, rarely, hornblende. Locally includes dacite and minor basalt | 1 | |

| ORQal;0 | ORQal | Alluvial deposits (Holocene) | Holocene | Sand, gravel, and silt forming flood plains and filling channels of present streams. In places includes talus and slope wash. Locally includes soils containing abundant organic material, and thin peat beds | 3 | |
|---------|-------|---|----------------------------|--|---|-------------------|
| ORQb;0 | ORQb | Basalt and basaltic andesite (Holocene and Pleistocene) | Pleistocene to Holocene | Thin flows of aphyric and porphyritic basalt and basaltic andesite, and open-textured (dikytaxitic), generally nonporphyritic, subophitic olivine basalt that commonly is highly feldspathic. Also includes some dissected intracanyon flows of porphyritic ba | 1 | |
| ORQba;0 | ORQba | Basaltic andesite and basalt (Holocene? and Pleistocene) | Quaternary | Flows and flow breccia dominantly of basaltic andesite containing plagioclase, olivine, and pyroxene phenocrysts and olivine-bearing basalt representing part of the volcanic sequence of the High Cascade Range (Thayer, 1937). Unit mostly forms small shiel | 1 | |
| ORQd;0 | ORQd | Dune sand (Holocene) | Holocene | Large areas of windblown sand composed of rock- forming minerals, mostly feldspar and small amounts of quartz, and, in southeastern Oregon, also pumice | 3 | |
| ORQf;0 | ORQf | Fanglomerate (Holocene? and Pleistocene) | Pleistocene to | Poorly sorted and poorly stratified alluvial fan debris, slope wash, colluvium, and talus; composed mostly of silt and fragments of basalt, basaltic andesite, and andesite. In places includes small areas of pediment gravels and colluvium | 3 | |
| ORQg;0 | ORQg | Glacial deposits (Pleistocene) | Pleistocene | Unsorted bouldery gravel, sand, and rock flour in ground, terminal, and lateral moraines. Locally partly sorted | 3 | |
| ORQgf;0 | ORQgf | Glaciofluvial deposits | Pleistocene | Poorly sorted | 3 | |
| ORQgs;0 | ORQgs | Glaciofluvial, lacustrine, and pediment sedimentary deposits (Holocene and Pleistocene) | Pleistocene | Unconsolidated, poorly sorted silt, sand, and gravel. Includes lacustrine deposits west of Columbia River Gorge (Trimble, 1963). Mostly in northern Morrow and Umatilla Counties where unit represents deposits of swollen late Pleistocene Columbia River (Ho | 3 | |
| ORQI;0 | ORQI | Loess (Holocene and Pleistocene) | Pleistocene to Holocene | Windblown clayey silt and fine sand. Includes the Pleistocene Palouse Formation and deposits derived mostly from reworking of Palouse Formation. Contains local interbedded layers of soil, caliche, and some water- laid silt and gravel | 3 | Palouse Formation |
| ORQIb:0 | ORQIb | Late basalt (Holocene or upper Pleistocene) | Late Pleistocene | Thin flows of scoriaceous, mostly olivine-bearing basalt in southeast Oregon; upper surfaces of flows characterized by blocky, spiny, or pahoehoe structures and by pressure ridges and tumuli, all essentially unmodified by erosion. Occurs at Diamond and J | 1 | |

| ORQls;0 | ORQIs | Landslide and debris-flow deposits (Holocene and Pleistocene) | Pleistocene to Holocene | Unstratified mixtures of fragments of adjacent bedrock. Locally includes slope wash and colluvium. Largest slides and debris flows occur where thick sections of basalt and andesite flows overlie clayey tuffaceous rocks. May include some deposits of late | 3 | |
|----------|--------|--|----------------------------|--|---|--|
| ORQma;0 | ORQma | Mazama ash-flow deposits (Holocene) | Holocene | Rhyodacitic to andesitic ash-flow deposits related to climactic eruptions of Mount Mazama about 6,845 yr B.P. (14C) (Bacon, 1983) | 3 | |
| ORQmp;0 | ORQmp | Mazama pumice deposits (Holocene) | Holocene | Primary and reworked air-fall rhyodacite pumice related to climactic eruptions of Mount Mazama about 6,845 yr B.P.(14C). Mapped only where it extensively covers older units | 3 | |
| ORQpl;0 | ORQpl | Playa deposits (Holocene) | Holocene | Clay, silt, sand, and some evaporites | 3 | |
| ORQrd;0 | ORQrd | Rhyolite and dacite (Holocene and Pleistocene) | Pleistocene to Holocene | Domes and related flows and flow breccia of aphyric and plagioclase and hornblende porphyritic rhyolite and dacite. Includes rhyolite and dacite on Newberry volcano and at South Sister volcano in the Cascade Range that are younger than Mazama ash deposit | 1 | |
| ORQs;0 | ORQs | Lacustrine and fluvial sedimentary rocks (Pleistocene) | Pleistocene | Unconsolidated to semiconsolidated lacustrine clay, silt, sand, and gravel; in places includes mudflow and fluvial deposits and discontinuous layers of peat. Includes older alluvium and related deposits of Piper (1942), Willamette Silt (Allison, 1953; We | 3 | |
| ORQt;0 | ORQt | Terrace, pediment, and lag gravels (Holocene and Pleistocene) | Pleistocene to Holocene | Unconsolidated deposits of gravel, cobbles, and boulders intermixed and locally interlayered with clay, silt, and sand. Mostly on terraces and pediments above present flood plains. Includes older alluvium of Smith and others (1982) in the Klamath Mountai | 2 | |
| ORQTa;0 | ORQTa | Andesite (Pleistocene and Pliocene) | Pliocene to Pleistocene | Flows and flow breccia in the High Cascade Province composed dominantly of aphyric to porphyritic basaltic andesite and andesite. Mostly represents remnants of moderately to deeply eroded stratovolcances. Phenocrysts are mostly plagioclase, olivine, clin | 1 | |
| ORQTb;0 | ORQTb | Basalt (Pleistocene and Pliocene) | Pliocene to Pleistocene | Thin flows and minor flow breccia of open-textured (diktytaxitic) olivine basalt in southeastern part of map area. Locally contains thin interbeds of sedimentary rocks. Grades laterally through palagonite tuff and breccia into sedimentary rocks (unit QT | 1 | |
| ORQTba;0 | ORQTba | Basalt and basaltic andesite (Pleistocene and Pliocene) | Pliocene to Pleistocene | Flows, flow breccia, and pyroclastic deposits. Flows are aphanitic to finely crystalline, commonly diktytaxitic, and aphyric to porphyritic. Textures are mostly intergranular grading to intersertal; some andesite flows are finely trachytic and a few basa | 1 | |
| ORQTg;0 | ORQTg | | Pliocene to Pleistocene | Unconsolidated to poorly consolidated, poorly sorted gravels and bouldery soil above modern stream channels. In Cascade Range, clasts mostly basalt and andesite. Includes some glacial outwash deposits. In Eastern Oregon, commonly cemented by caliche | 2 | |

| ORQTib;0 | ORQTib | Intrusive basalt and andesite (Pleistocene, Pliocene, and Miocene) | Miocene to Pleistocene | Sills, plugs and dikes of basaltic andesite, basalt, and andesite. In the Cascade Range most of these represent feeders, exposed by erosion, for flows and flow breccias of units T9a and Trb and a few are feeders for units QTba and QTa; in foothills of we | 1 | |
|----------|--------|---|-------------------------------------|--|---|--|
| ORQTmv;0 | ORQTmv | Mafic vent complexes (Pleistocene, Pliocene, and Miocene?) | Late Miocene to Pleistocene | Plugs, dikes, and related near-vent flows, breccia, cinders, and agglutinate of basalt, basaltic andesite, and andesite; commonly in the form of either little-modified lava cones or partly eroded piles of reddish, iron-stained thin flows and fragmental e | 1 | |
| ORQTp;0 | ORQTp | Pyroclastic ejecta of basaltic and andesitic cinder cones (Holocene, Pleistocene, Pliocene, and Miocene?) | Miocene to Holocene | Mostly unconsolidated, oxidized, fine to coarse, scoriaceous cinders, bombs, and agglutinate deposited in subaerial environment | 2 | |
| ORQTps;0 | ORQTps | Subaqueous pyroclastic ejecta of basaltic and andesitic cinder cones (Holocene, Pleistocene, Pliocene, and Miocene?) | | Partly consolidated, palagonitized, fine to coarse, scoriaceous altered cinders, bombs, breccia, and minor agglutinate, mostly deposited in subaqueous environment. Commonly with some interlayers and intermixed lacustrine sedimentary rocks. Forms palagoni | 2 | |
| ORQTs;0 | ORQTs | Sedimentary rocks (Pleistocene and Pliocene) | Pliocene to Pleistocene | Semiconsolidated lacustrine and fluvial ashy and palagonitic sedimentary rocks, mostly tuffaceous sandstone and siltstone; locally contains abundant palagonitized basaltic debris and some pebble conglomerate. Includes alluvial gravel and mudflow deposits | 3 | |
| ORQTst;0 | ORQTst | Tuffaceous sedimentary rocks and tuffs (lower? Pleistocene or Pliocene) | Pliocene to Early Pleistocene | Rhyolitic to andesitic ash-flow tuffs, pumice-fall deposits, minor mud flows, and older alluvium on the flanks of Newberry volcano (MacLeod and others, 1981; 1982) and in areas west and northwest of Bend | 3 | |
| ORQTvm;0 | ORQTvm | Mafic vent deposits (Pleistocene, Pliocene, and Miocene?) | Miocene to Pleistocene | Mostly in small stratovolcanoes or shield volcanoes and lava cones of basalt and andesite. Includes agglomerate, breccia, scoria, cinders, ash, restricted flows, and small basaltic intrusive bodies. Transitional into pyroclastic rocks of cinder cones (QT | 1 | |
| ORQTvs;0 | ORQTvs | Silicic vent deposits (Pleistocene and Pliocene) | Pliocene to Pleistocene | Complex domal masses of rhyolite and dacite that include near-vent flows, breccia, pumicite, perlite, obsidian, and ash-flow tuff | 2 | |
| ORQyb;0 | ORQyb | Youngest basalt and basaltic andesite (Holocene) | Holocene | Little-modified flows and associated breccia of basaltic andesite and some basalt in both central part of Cascade Range and on slopes of Newberry Volcano. Relations to Mazama pumice deposits indicate most of these rocks are less than 6.800 yr old (14C); | 1 | |
| ORTa;0 | ORTa | Alsea Formation (Oligocene and upper Eccene) | Late Eocene to Oligocene | Massive to thick-bedded tuffaceous marine siltstone and fine-grained sandstone; locally concretionary. Foraminiferal assemblages assigned to the Zemorrian and upper Refugian Stages (Kleinpell, 1938; Rau, 1975) and molluscan fauna assigned (Snavely and ot | 3 | |

| ORTas;0 | ORTas | Andesite and dacite and sedimentary rocks (Miocene? and Oligocene) | Oligocene to Miocene | Lava flows, breccia, volcaniclastic and epiclastic rocks mostly of andesitic and dacitic composition; includes minor amounts of altered basaltic rocks. Joint surfaces and cavities commonly lined with hematite or montmorillonite clay, secondary silica min | 2 | Alvord Creek Formation (OR064; formerly Alvord Creek Beds; 062) (OR026) Assir-riow i tui |
|----------|--------|--|-----------------------------------|--|---|---|
| ORTat;0 | ORTat | Silicic ash-flow tuff (lower Pliocene Land upper Miocene) | Late Miocene to Early Pliocene | Ash-flow tuff and associated pumiceous air-fall tuff mostly of rhyolitic and rhyodacitic composition; includes minor tuffaceous sedimentary rocks. Grades laterally through less-densely welded tuff to nonwelded ash-flow tuff and interlayered tuffaceous se | 3 | (OR026)Danforth Formation (obsolete) (OR018)Columbia River Group (OR008)Peyerl Tuff (OR032)Wildcat Creek Welded Ash-Flow Tuff (OR156; OR157) |
| ORTb;0 | ORTb | Basalt (upper and middle Miocene) | Middle to Late Miocene | Basalt flows, flow breccia, and basaltic peperite; minor andesite flows; some interbeds of tuff and tuffaceous sedimentary rocks. Basalt is aphyric to moderately porphyritic with phenocrysts of plagioclase and olivine and exhibits both subophitic and dik | 1 | articistic nows on Freezeout Mountain (Freezeout Mountain Voilcanics; OR141)Owyhee Basalt (OR023; OR024)Tims Peak Basalt (OR023; OR024)Blackjack Basalt (OR121)Flows of Hammond Hi |
| ORTba:0 | ORTba | | Miocene | Lava flows and breccia of aphyric and plagioclase porphyritic basalt and aphyric andesite; locally includes flow breccia, peperite, some palagonite tuff and breccia, and minor silicic ash-flow tuff and interbeds of tuffaceous sedimentary rocks. In Basin | 1 | Steens Basalt (Steens Mountain Basalt (OR118; OR062) Hunter Creek Basalt (OR023; OR024) Basalt and latite unit (OR159; OR165) Basalt of Bishop's Ranch (OR023; OR024) Flows of Prineville chemical type (OR049) Basalt of Malheur Gorge (OR114; OR117; former! |
| ORTbaa:0 | ORTbaa | Basaltic and andesitic rocks (upper | | Lava flows and flow breccia of hypersthene and olivine andesite, basaltic andesite containing plagioclase and pyroxene phenocrysts, and basalt; many flows contain phenocrysts of both hypersthene and augite. Includes interbedded volcaniclastic and epiclas | 1 | WILLIAM TO THE TOTAL THE TOTAL TO THE TOTAL TOTAL TO THE |
| ORTbas;0 | ORTbas | Andesitic and basaltic rocks on | Miocene | Called Steens Mountain Volcanic Series by Walker (1977); Steens Mountain Andesitic Series of Fuller (1931) and Williams and Compton (1953) | 1 | Steens Mountain Volcanics (OR184; formerly Steens Mountain Volcanic Series; OR062)Steens Mountain Andesitic Series (OR062; OR064)Pike Creek Formation (OR184; formerly |
| ORTc;0 | ORTc | Columbia River Basalt Group and related flows (Miocene) | Miocene | Subaerial basalt and minor andesite lava flows and flow breccia; submarine palagonitic tuff and pillow complexes of the Columbia River Basalt Group (Swanson and others, 1979); locally includes invasive basalt flows. Flows locally grade laterally into sub | 1 | Tcs, Saddle Mountains BasaltTcw, Wanapum BasaltTcg, Grande Ronde BasaltTcp, Picture Gorge BasaltTci, Imnaha Basalt |
| ORTca;0 | ORTca | (, | Paleocene to Early Oligocene | Mostly andesitic lava flows, domes, breccia, and small intrusive masses and lesser basaltic to rhyolitic rocks; interlayered saprolite, bedded volcaniclastic and epiclastic mudstone, claystone, siltstone, sandstone, conglomerate, and mudflow (lahar) depo | 2 | Clarno Formation |

| ORTcg;0 | ORTcg | Grande Ronde Basalt (middle and lower Miocene) | Early to Middle Miocene | Flows of dark-gray to black, aphyric tholeiltic basalt, including both high- and low-Mg chemical types (Swanson and others, 1979). Potassium-argon ages mostly in the range of 15 to 17 Ma (Lux, 1982; Watkins and Baksi, 1974; Fiebelkorn and others, 1983) | 1 | |
|------------|---------|---|-------------------------------------|--|---|--|
| ORTci;0 | ORTci | lmnaha Basalt (lower Miocene) | Early Miocene | Mostly coarse-grained, plagioclase porphyritic basalt; flows commonly contain zeolite amygdules and montmorillonitic alteration is widespread. Potassium- argon ages mostly 16 to 17 Ma (McKee and others, 1981) | 1 | |
| ORTco;0 | ORTco | Cowlitz Formation (upper and middle Eocene) | Middle Eocene to Late Eocene | Micaceous, arkosic to basaltic marine sandstone, siltstone, and mudstone. Foraminiferal assemblages are referred to the upper Narizian Stage of Mallory (1959) in Newton and Van Atta (1976) | 3 | |
| ORTcp;0 | ORTcp | Picture Gorge Basalt (middle and lower Miocene) | Early to Middle Miocene | Flows of aphyric and plagioclase porphyritic flood basalt. Potassium-argon ages mostly 15.0 to 16.4 Ma (Watkins and Baksi, 1974; Fiebelkorn and others, 1983) | 1 | |
| ORTcs;0 | ORTcs | Saddle Mountains Basalt (upper and middle Miocene) | Middle to Late Miocene | Petrographically diverse flows of basalt erupted between about 13.5 and 6 Ma (McKee and others, 1977; Swanson and others, 1979) | 1 | |
| ORTcss:0 | ORTcss | Continental sedimentary rocks | | Poorly sorted and poorly bedded, fine- to coarse-grained tuffaceous siltstone, sandstone, pebble conglomerate, agglomerate, volcanic cobble conglomerate, air-fall tuff, and rare basaltic andesite flows equivalent to those in unit Tba. Included in the Mio | 3 | |
| ORTct;0 | ORTct | Predominantly tuffaceous facies of Clarno Formation (lower Oligocene? and Eocene) | | Mapped separately by Swanson (1969a) in the Ochoco and Maury Mountains of the Blue Mountains Province | 3 | |
| ORTcw;0 | ORTcw | Wanapum Basalt (middle Miocene) | Middle Miocene | Flows of gray to dark-gray, medium-grained, commonly plagicolase porphyritic basalt of Frenchman Springs petrochemical type (Wright and others, 1973). Generally exhibits blocky to platy jointing, Potassium-argon ages mostly about 15 Ma (Lux, 1982; Fiebel | 1 | |
| ORTfc;0 | ORTfc | Flows and clastic rocks, undifferentiated (Miocene) | Miocene | Chiefly basaltic andesite and andesite lava flows and flow breccia containing plagioclase and pyroxene (hypersthene and augite) phenocrysts, mudflows (lahars), and volcanic conglomerates; locally includes some dacite flows. Includes lesser, coarse- to fi | 1 | |
| ORTfe;0 | ORTfe | Fisher and Eugene Formations and correlative rocks (Oligocene and upper Eocene) | Late Eocene to Oligocene | Thin to moderately thick bedded, coarse- to fine-grained arkosic and micaceous sandstone and siltstone, locally highly pumiceous, of the marine Eugene Formation; and coeval and older andesitic lapilli tuff, breccia, water-laid and air-fall silicic ash of | 3 | |
| ORTfeb:0 | ORTfeb | | Late Eocene to | | 1 | |

|-----------|---------|---|---------------------------------------|--|---|---|
| ORTfee?;0 | ORTfee? | Marine Eugene Formation, where mapped separately | Late Eocene to Oligocene | | 3 | |
| ORThi;0 | ORThi | Hypabyssal intrusive rocks (Miocene and Miocene?) | Miocene | Hypabyssal, medium-grained, hornblende diorite and quartz diorite in small stocks and large dikes; includes intrusions of medium- to fine-grained gabbro and plugs and small stocks of medium-grained, holocrystalline, olivine andesite. Also includes medium | 1 | |
| ORTi;0 | ORTi | Mafic intrusions (Oligocene) | Oligocene | Sheets, sills, and dikes of massive granophyric ferrogabbro; some bodies strongly differentiated and include pegmatitic gabbro, ferrogranophyre, and granophyre (MacLeod, 1981). Plagioclase and amphibole from unit have yielded K-Ar ages of about 30 Ma (Sn | 1 | |
| ORTia;0 | ORTia | Alkalic intrusive rocks (Oligocene and Eocene) | Eocene to Oligocene | Sills, dikes, stocks, and irregular intrusions of porphyritic or aphanitic camptonite, shonkinite, and, nepheline syenite or phonolite. Potassium-argon ages of 32 to 35 Ma obtained on camptonite and nepheline syenite (Snavely and others, 1976c; Fiebelkor | 1 | |
| ORTib;0 | ORTib | Basalt and andesite intrusions (Pliocene, Miocene, and Oligocene?) | Oligocene(?) to Pliocene | Sills, plugs and dikes of basaltic andesite, basalt, and andesite. Mostly represents feeders, exposed by erosion, for flows and flow breccias of units Tba and Trb. Includes a few dikes of hornblende and plagioclase porphyritic andesite, commonly altered, | 1 | |
| ORTig;0 | ORTig | Intrusive gabbroic rocks (Oligocene and Eocene) | Eocene to Oligocene | Sills and dikes of basalt, diabase, gabbro, and granophyric gabbro; locally albitized and zeolitized (Snavely and others, 1976a, b) | 1 | |
| ORTim1;0 | ORTim1 | Mafic and intermediate intrusive rocks (Miocene) | Miocene | Dikes, plugs, and sills of basalt, diabase, gabbro, and lesser andesite that fed many of the Miocene basalt and andesite flows in unit Tc. Some intrusions are rootless and are invasive into sedimentary sequences; includes related breccia and peperite. In | 1 | |
| ORTim2;0 | ORTim2 | Mafic and intermediate intrusive rocks (Pliocene and Miocene) | Miocene to Pliocene | Dikes, plugs, and sills of basalt, diabase, gabbro, and lesser andesite that fed many of the Miocene basalt and andesite flows in units Tc and Tba. |---|--------------------------------|-------------------|---|
| | | | |
| | mafic volcanic rock | | |
| Includes rhyolite of the Silver City Range, (15.6 17.8+0.3 Ma (K-Ar; OR060; OR159; OR165; OR185; OR195); Littlefield Rhyolite (OR023; OR024), 15.2-16.8 Ma (40Ar/39Ar; OR179); rhyolite of McIntyre Ridge (OR170; formerly Dooley Rhyolite Breccia; OR035) the | rhyolite | dacite | andesite |
| In OR301, unit identified as John Day Formation. Upper part includes rhyolite flows and domes. Elsewhere, mainly air-fall and water-laid tuffs and varicolored tuffaceous clays with some welded tuffs and argillized coarse pumice-lapilli tuffs. Base of | rhyolite | dacite | rhyodacite;alkali rhyolite; andesite |
| As shown, may include some Jurassic rocks. Not shown on State map (OR001), but present in the La Grande 100K quadrangle (OR291) and Umatilla River Basin (OR292) as part of Mountain Home Metamorphic Complex is chlorite-mica schist of Permian and (or) Tr | meta-argillite | greenstone | slate |
| | | | |
| Unit is considered possibly correlative with the Hayfork Terrane by Irwin (1994) | andesite | basalt | dacite |
| | | | |
| | intermediate metavolcanic rock | meta-basalt | spilite |
| Not present on State map (OR001) in northeastern Oregon, but, in La Grande 30' x 60' quadrangle (OR291) may be mapped as amphibolite, metagabbro, and metadiorite | | | |
| (Triassic and Permian) | gabbro | | |
| Considered part of Rattlesnake Creek Terrane | | | |
| by Irwin (1994) | metasedimentary rock | metavolcanic rock | serpentinite; gabbro |

| Most of unit is mapped as melange considered part of the Rattlesnake Creek Terrane by Irwin (1994) | mudstone | graywacke | conglomerate; chert; marble; tuff |
|--|------------------------|------------------------|--|
| Burnt River Schist encloses Nelson marble (unit TRPzsn), which was assigned a Late to Middle Triassic age based on conodonts (OR191). The Burnt River Schist is intruded by a 230 Ma (Middle Triassic) diorite (OR190). | argillite | chert | pelitic schist |
| | marble | phyllite | |
| Not defined on the State map (OR001) in the northeastern Oregon, but mapped in Umatilla River Basin (OR291) as ultramafic rocks (Triassic and Permian?) | peridotite | pyroxenite | gabbro |
| | argillite | shale | graywacke; limestone; tuff; chert; sandstone; lava flow |
| | mixed clastic/volcanic | | |
| Huntington Formation (OR073) is predominantly agglomerate, tuff, and flows intercalated with coarse volcaniclastic breccia and conglomerate. Also contains volcanic graywacke, volcanic arenite, water-laid tuff, volcanic siltstone, and minor limestone. V | andesite | mixed clastic/volcanic | basalt; dacite; rhyolite; sandstone; pyroclastic |
| Also includes Chalk Butte Formation (OR016), Drip Springs Formation (OR023; OR024), sediments of Captain Keeney Pass (OR153), Glenns Ferry Formation (OR154; OR155), and part of the Grassy Mountain Basalt (OR121).In northern half Umatilla River Basin (OR | sandstone | siltstone | mudstone; conglomerate; pumice; diatomite; tuff; conglomerate |

| UNITDESC Informally called the "Briggs Creek amphibolite" by Garcia (1976) and by Coleman and others (1976). | FSP |
|---|--------|
| Consists of amphibolite, micaceous quartzite, quartz schist, and recrystallized manganiferous chert. Includes structurally complex amphibole schist and qu Consists of a variety of schistose rocks characterized by different proportions of muscovite, quartz, graphite, chlorite, actinolite, and epidote, rare thin layers of metachert, and clinozoisite-actinolite-albite- | 1 |
| garnet metagabbro. Potassium-argon age on Metamorphosed pelitic sedimentary rocks and subordinate metamorphosed submarine pillow lavas and pyroclastic beds of basaltic composition. Metamorphic age is Early Cretaceous (about 130 Ma), | 2 |
| according to Coleman (1972), and protolith may be Jurassic or o | 2 1 |
| Informally named unit representing island-arc volcanic complex comprised predominantly of igneous and metamorphosed volcanic rocks; includes gabbro, metagabbro, quartz diorite, and amphibolite Structurally complex mixture of basaltic rocks, serpentinite, chert, argillite, conglomerate, silty | 1 |
| sandstone, and lenses of marble composing the melange of the Takilma area of Smith and others (1982) | 2 |
| Highly sheared graywacke, mudstone, siltstone, and shale with lenses and pods of sheared greenstone, limestone, chert, blueschist, and serpentine. Identified as melange by some investigators Black and gray mudstone, shale, siltstone, graywacke, andesitic to dacitic water-laid tuff, porcelaneous | 3 |
| tuff, and minor interlayers and lenses of limestone and fine-grained sediments metamorphosed to phyllite or slate. Locally includes some felsite, and | 3 |
| Black and gray mudstone, shale, siltstone, graywacke, andesitic to dacitic water-laid tuff, porcelaneous tuff, and minor interlayers and lenses of limestone and fine-grained sediments metamorphosed to | |
| phyllite or slate. Locally includes some felsite, and Black to gray shale, mudstone, and sandstone with local lenses of pebble conglomerate. Overlies Josephine ophiolite of Harper (1980) (unit Ju) | 3 |
| Felsic to intermediate, granitoid intrusive rocks. Includes Jurassic muscovite granodiorite, hornblende gabbro, tonalite, and quartz diorite of southwest Oregon (Smith and others, 1982) | 1 |
| Felsic to intermediate, granitoid intrusive rocks. Includes Jurassic muscovite granodiorite, hornblende gabbro, tonalite, and quartz diorite of southwest Oregon (Smith and others, 1982) Black, dark-gray, and dark -brownish-gray, thin-bedded siliceous or limy mudstone mostly consists of | 1 |
| the Hurwal Formation in the Wallowa Mountains. In lower and middle parts contains Triassic fossils and in upper part Early Jurassic fossils (Nolf, 1966). | 3 |
| Olive-drab, pale-brown, dark-gray, and black volcanic graywacke and siltstone; lesser conglomerate and slate, and minor limestone and chert. Includes more extensive outcrops of Triassic or Jurassic limestone at north base of Juniper Mountain in northern | 3 |
| Predominantly harzburgite and dunite with both cumulate and tectonite fabrics. Locally altered to serpentinite. Includes gabbroic rocks and sheeted diabasic dike complexes. Comprises Josephine ophiolite of Harper (1980), ophiolites of Onion Mountain, Sex | 2 |
| Basalt flows, flow breccia, agglomerate, pillow basalt and pillow breccia, and lesser shale, chert, siltstone, and mudstone of ophiolitic complexes | 2 |
| Lava flows, flow breccia, and agglomerate dominantly of plagioclase, pyroxene, and hornblende porphyritic and aphyric andesite. Includes flow rocks that range in composition from basalt to rhyolite as well as some interlayered tuff and tuffaceous sedimen | 1 |
| Locally fossiliferous sandstone and conglomerate; marine fossils indicate Early Cretaceous (Albian) age (Jones, 1960). Includes the Hornbrook Formation of Peck and others (1956), the Grove Creek strata of Jones (1960) and Page and others (1977), Hunters | 3 |
| Sandstone, conglomerate, graywacke, rhythmically banded chert lenses. Includes western Dothan and Otter Point Formations of M.C. Blake, Jr. and AS. Jayko (unpublished data, 1985) in Curry and southern Coos Counties | 3 |
| Sandstone, conglomerate, graywacke, rhythmically banded chert lenses. Includes western Dothan and Otter Point Formations of M.C. Blake, Jr. and AS. Jayko (unpublished data, 1985) in Curry and southern Coos Counties | 3 |
| Basaltic pillow lavas, volcanic breccia, and silicified basalt lava flows | 1 |

| Mostly tonalite and quartz diorite but including lesser amounts of other granitoid rocks. Potassium- argon ages determined on hornblende indicates plutons range in age from 143 to 166 Ma (Hotz, 1971) | 1 |
|--|---|
| Predominantly hornblende gabbro, gabbro, and olivine gabbro, but includes pyroxenite, hornblende pyroxene, and minor peridotite, dunite, and serpentinite (Smith and others, 1982) | 1 |
| Hornblende and biotite quartz diorite (tonalite), trondhjemite, granodiorite, and small amounts of norite, in batholithic masses and large dikelike bodies. Includes Bald Mountain Tonalite and Anthony Lake Granodiorite of Taubeneck (1957), tonalite and tr | 1 |
| Conglomerate, sandstone, siltstone, and limestone. Locally fossiliferous. As shown, includes Riddle and Days Creek Formations (Imlay and others, 1959; Jones, 1969) | 3 |
| Marine graywacke, subgraywacke, conglomerate, and shale. Pebbles and cobbles in conglomerate are well rounded volcanic and metavolcanic rocks, low-grade metasedimentary rocks, quartzite, chert, and minor silicic and intermediate plutonic rocks. Shales | 3 |
| Layered amphibolite, schist, gneiss, and quartzite. Protolith considered to be of Paleozoic age | 1 |
| Intermingled, commonly highly sheared metasedimentary, metavolcanic, and igneous rocks. Includes serpentinite, altered gabbro, chert, siliceous phyllite, greenstone, and limestone | 2 |
| Epiclastic and volcaniclastic rocks, chert, limestone, and lava flows of mid- or Early Permian(?) age that are moderately to intensely metamorphosed. Includes part of Hunsaker Creek Formation of Vallier (1977), in the eastern Blue Mountains province, com | 2 |
| Well-bedded limestone, fossiliferous cherty limestone, calcareous and carbonaceous sandstone, chert grit, argillite, and some conglomerate. In places foliated and metamorphosed. Includes fault slivers of Devonian rocks (Kleweno and Jeffords, 1961), Coffe | 2 |
| Undifferentiated sedimentary and volcanic rocks some of which are highly deformed and locally metamorphosed to amphibolite and schist. Occurs mostly in Strawberry and Aldrich Mountains of the Blue Mountains province. Includes undivided Paleozoic rocks an | 2 |
| Forms major stratovolcanoes dominantly of aphyric to porphyritic basaltic andesite and andesite; phenocrysts are principally pyroxene, olivine, plagioclase, and, rarely, hornblende. Locally includes dacite and minor basalt | 1 |
| | |
| Sand, gravel, and silt forming flood plains and filling channels of present streams. In places includes talus and slope wash. Locally includes soils containing abundant organic material, and thin peat beds | 3 |
| Thin flows of aphyric and porphyritic basalt and basaltic andesite, and open-textured (dikytaxitic), generally nonporphyritic, subophitic olivine basalt that commonly is highly feldspathic. Also includes some dissected intracanyon flows of porphyritic ba | 1 |
| Flows and flow breccia dominantly of basaltic andesite containing plagioclase, olivine, and pyroxene phenocrysts and olivine-bearing basalt representing part of the volcanic sequence of the High Cascade Range (Thayer, 1937). Unit mostly forms small shiel | 1 |
| | |
| Large areas of windblown sand composed of rock-forming minerals, mostly feldspar and small amounts of quartz, and, in southeastern Oregon, also pumice | 3 |
| Poorly sorted and poorly stratified alluvial fan debris, slope wash, colluvium, and talus; composed mostly of silt and fragments of basalt, basaltic andesite, and andesite. In places includes small areas of pediment gravels and colluvium | 3 |
| | |
| Unsorted bouldery gravel, sand, and rock flour in ground, terminal, and lateral moraines. Locally partly sorted | 3 |
| Poorly sorted | 3 |
| Unconsolidated, poorly sorted silt, sand, and gravel. Includes lacustrine deposits west of Columbia River Gorge (Trimble, 1963). Mostly in northern Morrow and Umatilla Counties where unit represents deposits of swollen late Pleistocene Columbia River (Ho | 3 |
| Windblown clayey silt and fine sand. Includes the Pleistocene Palouse Formation and deposits derived mostly from reworking of Palouse Formation. Contains local interbedded layers of soil, caliche, and some water-laid silt and gravel | 3 |
| Thin flows of scoriaceous, mostly olivine-bearing basalt in southeast Oregon; upper surfaces of flows characterized by blocky, spiny, or pahoehoe structures and by pressure ridges and tumuli, all essentially unmodified by erosion. Occurs at Diamond and J | 1 |
| | |
| Unstratified mixtures of fragments of adjacent bedrock. Locally includes slope wash and colluvium. Largest slides and debris flows occur where thick sections of basalt and andesite flows overlie clayey | _ |
| tuffaceous rocks. May include some deposits of late Rhyodacitic to andesitic ash-flow deposits related to climactic eruptions of Mount Mazama about 6,845 | 3 |
| yr B.P. (14C) (Bacon, 1983) | 3 |

| Primary and reworked air-fall rhyodacite pumice related to climactic eruptions of Mount Mazama about 6,845 yr B.P.(14C). Mapped only where it extensively covers older units Clay, silt, sand, and some evaporites | 3 |
|--|---|
| Domes and related flows and flow breccia of aphyric and plagioclase and hornblende porphyritic rhyolite and dacite. Includes rhyolite and dacite on Newberry volcano and at South Sister volcano in the Cascade Range that are younger than Mazama ash deposit | 1 |
| Unconsolidated to semiconsolidated lacustrine clay, silt, sand, and gravel; in places includes mudflow and fluvial deposits and discontinuous layers of peat. Includes older alluvium and related deposits of Piper (1942), Willamette Silt (Allison, 1953; We | 3 |
| Unconsolidated deposits of gravel, cobbles, and boulders intermixed and locally interlayered with clay, silt, and sand. Mostly on terraces and pediments above present flood plains. Includes older alluvium of Smith and others (1982) in the Klamath Mountai | 2 |
| Flows and flow breccia in the High Cascade Province composed dominantly of aphyric to porphyritic basaltic andesite and andesite. Mostly represents remnants of moderately to deeply eroded stratovolcanoes. Phenocrysts are mostly plagioclase, olivine, clin | 1 |
| Thin flows and minor flow breccia of opentextured (diktytaxitic) olivine basalt in southeastern part of map area. Locally contains thin interbeds of sedimentary rocks. Grades laterally through palagonite tuff and breccia into sedimentary rocks (unit QT | 1 |
| Flows, flow breccia, and pyroclastic deposits. Flows are aphanitic to finely crystalline, commonly diktytaxitic, and aphyric to porphyritic. Textures are mostly intergranular grading to intersertal; some andesite flows are finely trachytic and a few basa | 1 |
| Unconsolidated to poorly consolidated, poorly sorted gravels and bouldery soil above modern stream channels. In Cascade Range, clasts mostly basalt and andesite. Includes some glacial outwash deposits. In Eastern Oregon, commonly cemented by caliche | 2 |
| Sills, plugs and dikes of basaltic andesite, basalt, and andesite. In the Cascade Range most of these represent feeders, exposed by erosion, for flows and flow breccias of units Tba and Trb and a few are feeders for units QTba and QTa; in foothills of we | 1 |
| Plugs, dikes, and related near-vent flows, breccia, cinders, and agglutinate of basalt, basaltic andesite, and andesite; commonly in the form of either little-modified lava cones or partly eroded piles of reddish, iron-stained thin flows and fragmental e | 1 |
| Mostly unconsolidated, oxidized, fine to coarse, scoriaceous cinders, bombs, and agglutinate deposited in subaerial environment | 2 |
| Partly consolidated, palagonitized, fine to coarse, scoriaceous altered cinders, bombs, breccia, and minor agglutinate, mostly deposited in subaqueous environment. Commonly with some interlayers and intermixed lacustrine sedimentary rocks. Forms palagoni | 2 |
| Semiconsolidated lacustrine and fluvial ashy and palagonitic sedimentary rocks, mostly tuffaceous sandstone and siltstone; locally contains abundant palagonitized basaltic debris and some pebble conglomerate. Includes alluvial gravel and mudflow deposits | 3 |
| Rhyolitic to andesitic ash-flow tuffs, pumice-fall deposits, minor mud flows, and older alluvium on the flanks of Newberry volcano (MacLeod and others, 1981; 1982) and in areas west and northwest of Bend | 3 |
| Mostly in small stratovolcanoes or shield volcanoes and lava cones of basalt and andesite. Includes agglomerate, breccia, scoria, cinders, ash, restricted flows, and small basaltic intrusive bodies. Transitional into pyroclastic rocks of cinder cones (QT | 1 |
| Complex domail masses of rhyolite and dacite that include near-vent flows, breccia, pumicite, perlite, obsidian, and ash-flow tuff | 2 |
| Little-modified flows and associated breccia of basaltic andesite and some basalt in both central part of Cascade Range and on slopes of Newberry Volcano. Relations to Mazama pumice deposits indicate most of these rocks are less than 6,800 yr old (14C); | 1 |
| Massive to thick-bedded tuffaceous marine siltstone and fine-grained sandstone; locally concretionary. Foraminiferal assemblages assigned to the Zemorrian and upper Refugian Stages (Kleinpell, 1938; Rau, 1975) and molluscan fauna assigned (Snavely and ot | 3 |
| Lava flows, breccia, volcaniclastic and epiclastic rocks mostly of andesitic and dacitic composition; includes minor amounts of altered basaltic rocks. Joint surfaces and cavities commonly lined with hematite or montmorillonite clay, secondary silica min | 2 |
| Ash-flow tuff and associated pumiceous air-fall tuff mostly of rhyolitic and rhyodacitic composition; includes minor tuffaceous sedimentary rocks. Grades laterally through less-densely welded tuff to nonwelded ash-flow tuff and interlayered tuffaceous se | 3 |
| Basalt flows, flow breccia, and basaltic peperite; minor andesite flows; some interbeds of tuff and tuffaceous sedimentary rocks. Basalt is aphyric to moderately porphyritic with phenocrysts of plagioclase and olivine and exhibits both subophitic and dik | 1 |

| Lava flows and breccia of aphyric and plagioclase porphyritic basalt and aphyric andesite; loca includes flow breccia, peperite, some palagonite tuff and breccia, and minor silicic ash-flow tuff interbeds of tuffaceous sedimentary rocks. In Basin | • |
|--|-------------|
| Lava flows and flow breccia of hypersthene and olivine andesite, basaltic andesite containing plagioclase and pyroxene phenocrysts, and basalt; many flows contain phenocrysts of both hypersthene and augite. Includes interbedded volcaniclastic and epiclas | 1 |
| | |
| Called Steens Mountain Volcanic Series by Walker (1977); Steens Mountain Andesitic Series of (1931) and Williams and Compton (1953) | 1 |
| Subaerial basalt and minor andesite lava flows and flow breccia; submarine palagonitic tuff and complexes of the Columbia River Basalt Group (Swanson and others, 1979); locally includes in basalt flows. Flows locally grade laterally into sub | • |
| Mostly andesitic lava flows, domes, breccia, and small intrusive masses and lesser basaltic to rocks; interlayered saprolite, bedded volcaniclastic and epiclastic mudstone, claystone, siltston sandstone, conglomerate, and mudflow (lahar) depo | |
| Flows of dark-gray to black, aphyric tholeitic basalt, including both high- and low-Mg chemical (Swanson and others, 1979). Potassium-argon ages mostly in the range of 15 to 17 Ma (Lux, 1 Watkins and Baksi, 1974; Fiebelkorn and others, 1983) | |
| Mostly coarse-grained, plagioclase porphyritic basalt; flows commonly contain zeolite amygduli montmorillonitic alteration is widespread. Potassium-argon ages mostly 16 to 17 Ma (McKee al others, 1981) | |
| Micaceous, arkosic to basaltic marine sandstone, siltstone, and mudstone. Foraminiferal asser | nblages |
| are referred to the upper Narizian Stage of Mallory (1959) in Newton and Van Atta (1976) Flows of aphyric and plagioclase porphyritic flood basalt. Potassium-argon ages mostly 15.0 to | 3 16.4 |
| Ma (Watkins and Baksi, 1974; Fiebelkorn and others, 1983) | 1 |
| Petrographically diverse flows of basalt erupted between about 13.5 and 6 Ma (McKee and oth 1977; Swanson and others, 1979) | ers, 1 |
| Poorly sorted and poorly bedded, fine- to coarse-grained tuffaceous siltstone, sandstone, pebb conglomerate, agglomerate, volcanic cobble conglomerate, air-fall tuff, and rare basaltic andes equivalent to those in unit Tba. Included in the Mio | |
| Mapped separately by Swanson (1969a) in the Ochoco and Maury Mountains of the Blue Mount | ntains 3 |
| Flows of gray to dark-gray, medium-grained, commonly plagioclase porphyritic basalt of French Springs petrochemical type (Wright and others, 1973). Generally exhibits blocky to platy jointing Potassium-argon ages mostly about 15 Ma (Lux, 1982; Fiebel | |
| Chiefly basaltic andesite and andesite lava flows and flow breccia containing plagioclase and p (hypersthene and augite) phenocrysts, mudflows (lahars), and volcanic conglomerates; locally some dacite flows. Includes lesser, coarse- to fi | • |
| Thin to moderately thick bedded, coarse- to fine-grained arkosic and micaceous sandstone and siltstone, locally highly pumiceous, of the marine Eugene Formation; and coeval and older and | t |
| lapilli tuff, breccia, water-laid and air-fall silicic ash of | 3 |
| Probably part of Fisher Formation | 1 |
| | 3 |
| | 3 |
| Hypabyssal, medium-grained, hornblende diorite and quartz diorite in small stocks and large di includes intrusions of medium- to fine-grained gabbro and plugs and small stocks of medium-g holocrystalline, olivine andesite. Also includes medium | |
| Sheets, sills, and dikes of massive granophyric ferrogabbro; some bodies strongly differentiate include pegmatitic gabbro, ferrogranophyre, and granophyre (MacLeod, 1981). Plagioclase and amphibole from unit have yielded K-Ar ages of about 30 Ma (Sn | 1 |
| Sills, dikes, stocks, and irregular intrusions of porphyritic or aphanitic camptonite, shonkinite, an nepheline syenite or phonolite. Potassium-argon ages of 32 to 35 Ma obtained on camptonite an nepheline syenite (Snavely and others, 1976c; Fiebelkor | and 1 |
| Sills, plugs and dikes of basaltic andesite, basalt, and andesite. Mostly represents feeders, experosion, for flows and flow breccias of units Tba and Trb. Includes a few dikes of hornblende at plagioclase porphyritic andesite, commonly altered, | |
| Sills and dikes of basalt, diabase, gabbro, and granophyric gabbro; locally albitized and zeolitiz | |

| Dikes, plugs, and sills of basalt, diabase, gabbro, and lesser andesite that fed many of the Miocene basalt and andesite flows in unit Tc. Some intrusions are rootless and are invasive into sedimentary sequences; includes related breccia and peperite. In | 1 |
|--|---|
| Dikes, plugs, and sills of basalt, diabase, gabbro, and lesser andesite that fed many of the Miocene basalt and andesite flows in units Tc and Tba. Some intrusions are rootless and are invasive into sedimentary sequences; includes related breccia and pe | 1 |
| Poorly to moderately consolidated, bedded silicic ash and pumicite, diatomite, tuffaceous sedimentary rocks, minor mudflow deposits, and some coarse epiclastic deposits. Vitroclastic material in some beds diagenetically altered to zeolites, secondary sil | 3 |
| Massive, thick-bedded sandstone with minor interbeds of siltstone; local fossiliferous conglomerate lenses. Includes principally the Empire Formation of Baldwin (in Beaulieu and Hughes, 1975), originally considered of Pliocene age, but, on the basis of c | 3 |
| Fine- to medium-grained Marine siltstone and sandstone that commonly contains tuff beds. Includes the Astoria Formation, which is mostly micaceous and carbonaceous sandstone, and the middle Miocene Gnat Creek Formation of Niem and Niem (1985), which over | 3 |
| Cobble and pebble conglomerate, pebbly sandstone, lithic sandstone, siltstone, and mudstone; massive to thin bedded; shelf and slope depositional setting. Contains foraminiferal faunas referred to the Penutian Stage of early Eocene age. Included by Dille | 3 |
| Rhythmically interbedded sandstone, siltstone, and mudstone with minor conglomerate; deposited in deep-sea fan depositional setting on submarine basalts of the Siletz River Volcanics. Contains foraminiferal faunas referred to the Penutian Stage of early | 3 |
| Thin- to thick-bedded, crossbedded, well-sorted, fine- to medium-grain sandstone, siltstone, and mudstone; characterized by sparse fine white mica; shallow marine depositional setting at least partly of deltaic origin. Contains foraminiferal and mollusca | 3 |
| Tuffaceous and arkosic sandstone, locally fossiliferous, tuffaceous siltstone, tuff, glauconitic sandstone, minor conglomerate layers and lenses, and a few thin coal beds. Includes Scappoose Formation (Trimble, 1963; Wells and others, 1983), mudstone of | 3 |
| Intrusive plugs and dike swarms and related near-vent flows, breccias, cinders, and agglutinate of basaltic andesite, basalt, and andesite; commonly in the form of eroded piles of red, iron-stained thin flows, cinders, and agglutinate cut by mafic intrus | 1 |
| Continentally derived conglomerate, pebble conglomerate, sandstone, siltstone, and mudstone containing abundant biotite and muscovite. Dominantly nonvolcanic; clastic material derived from underlying older rocks | 3 |
| | |
| Thin, commonly open-textured (diktytaxitic), subophitic to intergranular olivine basalt flows, intercalated with and grades laterally through palagonite breccia and tuff into tuffaceous sedimentary rocks (unit Ts). In places includes flows of platy olivi | 2 |
| Thin, commonly open-textured (diktytaxitic), subophitic to intergranular olivine basalt flows, intercalated with and grades laterally through palagonite breccia and tuff into tuffaceous sedimentary rocks (unit Ts). In places includes flows of platy olivi | 2 |
| Mostly unconsolidated, oxidized, fine to course, scoriaceous cinders, bombs, and agglutinate deposited in subaerial environment | 2 |
| Subaerial lava flows and breccia of porphyritic basalt, minor basaltic andesite, and rare dacite. Includes basalt of Cascade Head (Wells and others, 1983), Yachats Basalt (Snavely and others, 1976c) and Goble Volcanic Series (Warren and others, 1945). Al | 1 |
| Deposits of bombs, breccia, and mafic to intermediate tuff; occurs as palagonitic tuff and breccia cones, rings, and ridges. In places interbedded with lacustrine sedimentary rocks | 2 |
| Mostly light-gray to red, dense, flow-banded, nonporphyritic and porphyritic rhyolite and dacite in nested domes, small intrusive bodies, and related flows. Includes some near-vent breccias, pumice-lapilli tuffs, and coarse pumicites. Commonly associated | 1 |
| Flows and flow breccia of basaltic andesite and lesser diktytaxitic to intergranular olivine basalt. Includes some dense, aphyric flows, commonly with either cryptocrystalline or pilotaxitic to trachytic texture, and porphyritic flows with phenocrysts an | 1 |
| • • • • | |
| Ash-flow tuff, lava flows, pumice-lapilli tuff, coarse pumicite, flow breccia, and domal complexes of rhyolitic, rhyodacitic, and dacitic composition; in places includes peralkaline rhyolite and some andesite and andesite breccia. Locally porphyritic wit | 2 |
| Ash-flow tuff, lava flows, pumice-lapilli tuff, coarse pumicite, flow breccia, and domal complexes of rhyolitic, rhyodacitic, and dacitic composition; in places includes peralkaline rhyolite and some andesite and andesite breccia. Locally porphyritic wit | 2 |
| Complexly folded, locally highly foliated and recrystallized undifferentiated sedimentary and volcanic rocks that in places are lithologically similar to Jurassic and Triassic rocks in the Aldrich Mountains of the Blue Mountains province and in other pla | 2 |
| | |

| Massixe flows of porphyritic meta-andesite, metabasalt, spillet, and keratophyre, volcanic broccia, and subordinate amounts of fine-grained volcanicalistic rocks. In southwest Oregon includes homblende, pyroxene, and plagioclase porphyritic andesite flow Massixe flows of porphyritic meta-andesite. The process of the property of the | | |
|--|--|---|
| subordinate amounts of fine-grained volcaniclastic rocks. In eastern Oregon probably mostly Late Triassic in age, but includes some Permian rocks (OR Most gabbro genetically related to ultramafic rocks, but some probably derived from metamorphism of Triassic and older volcanic rocks Heterogeneous mixture of interlayered metasedimentary and metavolcanic rocks metamorphosed to upper greenschist and (or) almandine-amphibolite facies, and serpentinite, gabbro, and metagabbro (Smith and others, 1982) Poorly bedded argilite, chert, phyllte, phyllte quartzite, cale-phyllte, impure limestone, and marble. In places rocks are strongly foliated. Sparse fossils (Fusilina, corals, and crimoids) indicate that the unit includes rocks of Leonardian. Och Informally called the "Nelson marble" by Prostka (1967). Light-gray, fine-grained marble and medium- to dark-gray calcareous phylltie, exposed in a nearly continuous band from the Snake River westward through Nelson Station, about 6 km southeast of Durke Peridotite, pyroxenite, gabbro, and norite. Light-green, gray, and black serpentine, mostly derived from peridotite, commonly highly sheared, in places includes some metavolcanic rocks and metamorphosed inclusions of keratophyre and chert. Includes ultra Black, green, and gray argillite, mudstone, and shale; graywacke, sandy limestone, tuff, and some coarse volcaniclastic rocks; chert, sandstone comprised of chert clasts, and chert pebble conglomerate; thin-bedded and massive limestone. Locally contains Green to gray spille and keratophyre flows and flow breccia; and subordinate amounts of coarse volcaniclastic or and the process, and the strong of marba River, and in several areas ma Green to gray spille and keratophyre flows and flow breccia; and subordinate amounts of coarse volcaniclastic sandstone, fuff, sandstone, siltstone, chert, conglomerate, and limestone, Marine fauna from interlayered sedimentary rocks and volcanic rocks, locally signific, and furity sandstone and shale siltstone, sandstone, and conglomerate, | subordinate amounts of fine-grained volcaniclastic rocks. In southwest Oregon includes hornblende, | 1 |
| Trassic and older volcanic rocks 1 Heterogeneous mixture of interlayered metasedimentary and metavolcanic rocks metamorphosed to upper greenschist and (or) almandine-amphibolite facies, and serpentinite, gabbro, and metagabbro (Smith and others, 1982) Poorly bedded argilitie, chert, phyllite, phyllitic quartzite, calc-phyllite, impure limestone, and marble. In places rocks are strongly foliated. In Klamath Mountains of southwest Oregon, includes shale, mudstone, volcaniclastic sandstone, graywacke, co. Poorly bedded argilitie, chert, phyllite, phyllitie quartzite, calc-phyllite, impure limestone, and marble. In places rocks are strongly foliated. Sparse fossils (Fusilina, corals, and crinoids) indicate that the unit includes rocks of Leonardian, Och Poorly bedded argilitie, chert, phyllite, phyllite, phyllite, and provided the thermal of the phyllite, exposed in a nearly continuous band from the Snake River westward through Nelson Station, about 8 km southeast of Durke Peridotite, pyroxenite, gabbro, and norite, Light-green, gray, and black serpentine, mostly derived from peridotite, commonly highly sheared; in places includes some metavolcanic rocks and metamorphosed inclusions of keratophyre and chert, Includes ultra inclusions of keratophyre and chert, Includes the metagabard of the periodocard pe | subordinate amounts of fine-grained volcaniclastic rocks. | Very thick sequence of rhymically bedded, medium- to fine-grained micaceous, feldspathic, lithic, or arkosic marine sandstone and micaceous carbonaceous siltstone; contains minor interbeds of dacite tuff in upper part. Foraminiferal fauna are referred to | 3 |
|---|---|
| Moderately well indurated lacustrine and fluvial (flood-plain) deposits of tuff, pumicite, palagonite tuff, and lesser siltstone, arkosic sandstone, and pebble and cobble conglomerate. Locally contains some lignite beds. Former glass in silicic vitroclas | 3 |
| Subaerial basaltic flows and breccia and submarine basaltic breccia, pillow lavas, lapilli and augite-rich tuff with interbeds of basaltic sandstone, siltstone, and conglomerate. Includes some basaltic andesite and, near the top of the sequence, some dac | 2 |
| Basaltic clastic rocks and pillow lavas, locally mapped separately by Wells and others (1983). Foraminiferal assemblages are assigned to the lower part of the Narizian Stage of Mallory (1959); see Wells and others (1983) for summary | 2 |
| Basaltic clastic rocks and pillow lavas, locally mapped separately by Wells and others (1983). Foraminiferal assemblages are assigned to the lower part of the Narizian Stage of Mallory (1959); see Wells and others (1983) for summary | 2 |
| Heterogeneous assemblage of continental, largely volcanogenic deposits of basalt and basaltic andesite, including flows and breccia, complexly interstratified with epiclastic and volcaniclastic deposits of basaltic to rhyodacitic composition. Includes ex | 2 |
| Basaltic and basaltic andesite lava flows and breccia; grades laterally into rare bedded palagonitic tuff and breccia | 1 |
| Basaltic and basaltic andesite lava flows and breccia; grades laterally into rare bedded palagonitic tuff and breccia | 1 |
| Lapilli tuff, mudflow deposits (lahars), flow breccia, and volcanic conglomerate, mostly of basaltic to dacitic composition; rare iron-stained palagonitic tuff and breccia of basaltic and andesitic composition; and ash-flow, air-fall, and water-laid tuff | 2 |
| Welded to unwelded, mostly vitric crystal and vitric ash-flow tuff of several ages. Glass in tuff locally altered to clay, zeolites, and secondary silica minerals | 3 |
| Mostly plugs, dikes, and irregular intrusive bodies of basaltic andesite and porphyritic hornblende or pyroxene andesite. Represents some of vents for unit Tca and possibly for unit Tas | 1 |
| Basaltic and andesitic agglomerate, breccia, scoria, cinders, flows, and intrusive masses forming lava cones and small shields | 1 |
| Basaltic and andesitic agglomerate, breccia, scoria, cinders, flows, and intrusive masses forming lava cones and small shields | 1 |
| Plugs and domal complexes of rhyolitic, rhyodacitic, and dacitic composition; includes related near- vent flows, flow breccia, and deposits of obsidian, perlite, and pumice. Locally includes resurgent domes related to caldera complexes. In southeast Orego | 1 |
| Partly to densely welded vitric and vitric-crystal tuff of soda-rhyolitic, rhyolitic, and rhyodacitic composition that interfingers with and grades laterally into unit Tit. Includes some nonwelded ash-flow tuff and tuffaceous sedimentary rocks. Potassium | 2 |
| Partly to densely welded vitric and vitric-crystal tuff of soda-rhyolitic, rhyolitic, and rhyodacitic composition that interfingers with and grades laterally into unit Tit. Includes some nonwelded ash-flow tuff and tuffaceous sedimentary rocks. Potassium | 2 |
| Massive to thin-bedded concretionary marine siltstone and thin interbeds of arkosic, glauconitic, and basaltic sandstone; locally contains interlayered basalt lava flows and lapilli tuff. Foraminiferal assemblages in siltstone referred to the Ulatisian a | 3 |
| Thick- to thin-bedded sandstone, conglomerate, and tuffaceous siltstone of deltaic origin; locally contains thin coal and ash beds. Conglomerate contains abundant clasts of pumice and dacitic volcanic rocks. In places includes thick lenses of marine tuff water | 3 |

Considered part of Pickett Peak Terrane by Blake and others (1985).

The area mapped as Jc on the State Geologic Map is shown as "amphibolite gneiss" by Coleman (1972). This area is not the same as the area that includes the informally designated Chetco River complex of Hotz (1971), which is 10-20 km farther east.

Considered part of the Rattlesnake Creek Terrane by Irwin (1994)

Considered part of the Gold Beach Terrane by Blake and others (1985).

Graylock Formation (OR028)Mowich Group (OR028)Snowshoe Formation (OR070)Shaw Member of Snowshoe Formation (OR028)Keller Creek Shale (OR008)Weberg Formation (OR070)Warm Springs Formation (OR070)Trowbridge Formation (OR070)Lonesome Formation (OR070

Unit is correlative with and lithologically similar to the Galice Formation.

Includes part of the Chetco River complex of Hotz (1971).

Oxbow Complex (OR104; OR105)Canyon Mountain Complex (OR008; OR078)

Hurwal Formation (OR074)

Weatherby Formation (OR186)

Metamorphosed equivalent rocks may be in the Mountain Home Metamorphic Complex (OR291; OR292)

Weatherby Formation (OR186) along south side of Burnt River is largely massive metagraywacke and contains cannibalistic conglomerate and tabular slide blocks of serpentine-matrix melange as much as a few hundred meters long, presumably from the Baker ter

Houstenaden Creek Formation

Part of unit in southwesternmost Oregon was mislabeled "Ks" on the State Geologic Map. The Humbug Mountain Conglomerate and Rocky Point Formation are considered part of the Elk Subterrane of the Western Klamath Terrane by Blakc and others (1985); the Ho

Considered part of the Yolla Bolly Terrane by Blake and others (1985)

Considered part of Sixes River Terrane by Blake and others (1985).

Considered part of the Yolla Bolly Terrane by Blake and others (1985), which includes part of the Franciscan Complex in California.

In OR291, unit includes three composite intrusions consisting of smaller individual intrusions that are chemically and petrographically distinct. The largest composite intrusion is the Bald Mountain batholith, which consists of the Elkhorn pluton (Lower

Part of Snow Camp Terrane of Blake and others (1985)

Hudspeth Formation (OR049)Gable Creek Formation (OR049)Bernard Formation (OR028)

Unit consists of a structurally higher subunit of metasedimentary rocks (May Creek Schist) and a structurally lower subunit of amphibolite as mapped by Irwin (1994)

Includes blueschist. Pennsylvanian and Permian fusilinids have been identified in some blocks of limestone (M.K. Nestell, personal commun., 1993)

Hunsaker Creek Formation (OR075)

Coffee Creek Formation (OR085; OR091)Spotted Ridge Formation (OR085; OR091)

Dixie Butte Meta-andesite

The southwest quarter of the Bates 15' quadrangle (OR092) was renamed "Dixie Butte" quadrangle.

stratocones

Includes silt and fine sand deposited on broad benches adjacent to the Snake and Malheur Rivers by the Bonneville Flood (OR143; OR144; OR145; OR146) 14,000 years ago (late Pleistocene). In OR291, includes lacustrine silt, clay, and diatomite.

Similar flows along the Owyhee River south of Rome (OR147) are included in map unit Tb.

smaller cones and flows

Eolian deposits not included in State map in La Grande area, but mapped in OR291, where it contains 0.5-1-m-thick accumulations of Mazama Aas (6.7 ka). Eolian deposits also mapped in the Hermiston area, northwestern Umatilla River Basin (OR292) near Col

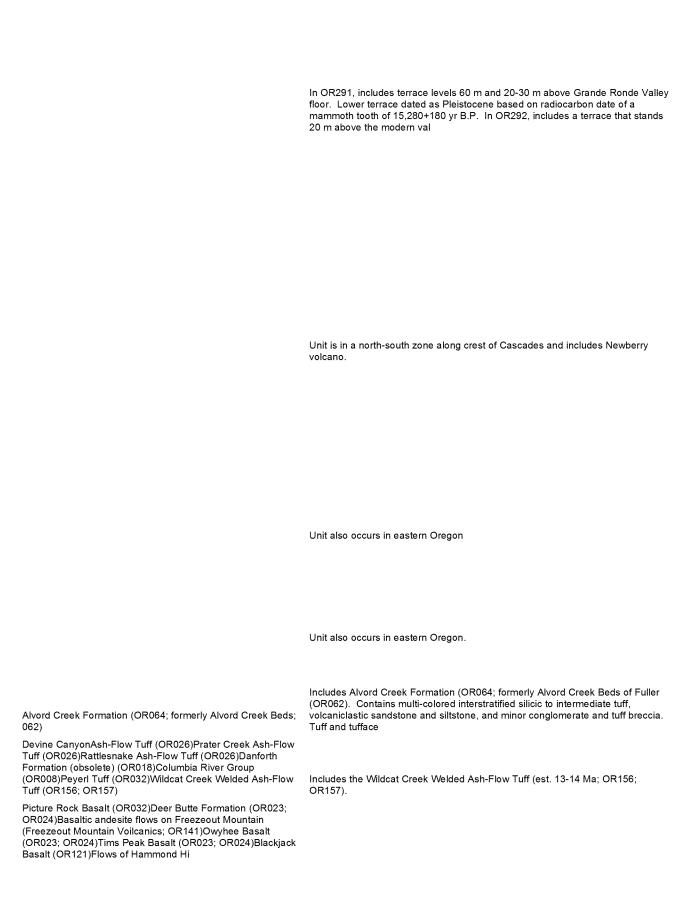

Alluvial fan deposits not presented in State map (OR001) in Umatilla River Basin, but mapped there in OR292 on the western flank of the Blue Mountains uplift

In OR291, glacial deposits include well preserved lateral and recessional morraines of late Pleistocene (10-30 ka) Pinedale glaciation and more poorly preserved lateral moraines of middle Pleistocene (150-200 ka) Bull Lake glaciation

In OR292, unit includes late Pleistocene Missoula flood deposits consisting of unconsolidated to semi-consolidated deposits of sand, gravel, and silt

Palouse Formation

In OR291, includes active or recently active slides marked by tilted trees and bent tree trunks. Includes debris flow deposits along the margins of Grande Ronde Valley formed during catastrophic collapse of high-standing dacite cliffs at Mt. Emily.Lands

Steens Basalt (Steens Mountain Basalt (OR118; OR062)Hunter Creek Basalt (OR023; OR024)Basalt and latite unit (OR159; OR165)Basalt of Bishop's Ranch (OR023; OR024)Flows of Prineville chemical type (OR049)Basalt of Malheur Gorge (OR114; OR117; formerl

Basalt of Malheur Gorge was formerly "unnamed igneous complex"; OR023; OR024). Unit includes part of middle Miocene Shumway Ranch Basalt (OR023; OR024); a poorly detailed thick section of basalt, andesite, and intercalated tuffaceous sedimentary rocks

Steens Mountain Volcanics (OR184; formerly Steens Mountain Volcanic Series; OR062)Steens Mountain Andesitic Series (OR062; OR064)Pike Creek Formation (OR184; formerly

Tcs, Saddle Mountains BasaltTcw, Wanapum BasaltTcg, Grande Ronde BasaltTcp, Picture Gorge BasaltTci, Imnaha Basalt Two dacite flows, a rhyolite dome, and a basalt flow were dated at 22.4 Ma (upper flow), 23.6+0.7 Ma (middle flow), and 22.1+0.7 Ma (OR184). Steens Mountain Volcanics (OR184; formerly OR062 and OR064) consists of hornblende-and pyroxene-hornblende-bear

Clarno Formation

Unit in Umatilla River Basin (OR292) is interpreted as mostly Paleogene volcanic rocks (Eocene, Oligocene, and early Miocene?) that are mainly porphyritic andesite and dacite flows. Includes domes, volcaniclastic deposits, and shallow intrusions, basalt

In La Grange 30' x 60' quadrangle (OR291), unit is divided into: N2 magnetostratigraphic unit (msu; middle Miocene), pyroclastic vent deposits (middle Miocene), Ferroandesite of Fiddlers Hell (middle Miocene), R2 msu (middle Miocene), N1 msu (middle Mioc

In La Grande 30' x 60' quadrangle (OR291), unit includes Dayville Basalt, Monument Mountain Basalt, and Twickenham Basalt, all middle Miocene

In Umatilla River Basin (OR292), includes the Pomona and Umatilla Members.

In La Grande 30' x 60' quadrangle (OR291), unit includes only the Frenchman Springs Member. In the Umatilla River Basin (OR292), includes the basalt of Powatka, Frenchman Springs Member, Sentinel Gap unit, Sand Hollow unit, and basalt of Lookingglass.

Northwestern Oregon

Gabbro dikes, sills, and at least one plug intrude Steens Basalt in Northern Pueblo Mountains and are substantial in size, but too small to appear on State geologic map (OR252)

Deer Butte Formation (OR016; OR023; OR024)Juntura Formation (OR015)Columbia River Basalt Group (OR001)Danforth Formation (obsolete) (OR018)Leslie Gulch Ash-Flow Tuff (OR173)Tuff of Spring Creek (OR173)

Includes Leslie Gulch Ash-Flow Tuff and Tuff of Spring Creek (OR173)

Dalles Formation (OR011; OR012)Grassy Mountain Basalt (OR016)Danforth Formation (obsolete; OR018; OR026)Antelope Flat Basalt (OR023; OR024)Madras (Deschutes) Formation (OR001)Shumuray Ranch Basalt (OR023; OR024)Hayes Butte Basalt (OR032)Drinkwater

Rhododendron Formation

Rhyolite at Owyhee Dam (OR023)Jump Creek Rhyolite (OR023)Rhyolite of Double Mountain (OR136)Littlefield Rhyolite Includes rhyolite of the Silver City Range, (15.6-17.8+0.3 Ma (K-Ar; OR060; (OR023; OR024)Dooley Volcanics (OR170; formerly Dooley Volcanic Breccia; OR035)Rhyolite of Cottonwood Mountain (OR285; OR286; formerly r

OR159; OR165; OR185; OR195); Littlefield Rhyolite (OR023; OR024), 15.2-16.8 Ma (40Ar/39Ar; OR179); rhyolite of McIntyre Ridge (OR170; formerly Dooley Rhyolite Breccia; OR035) the

In OR301, unit identified as John Day Formation. Upper part includes rhyolite flows and domes. Elsewhere, mainly air-fall and water-laid tuffs and varicolored tuffaceous clays with some welded tuffs and argillized coarse pumice-lapilli tuffs. Base of

As shown, may include some Jurassic rocks. Not shown on State map (OR001), but present in the La Grande 100K quadrangle (OR291) and Umatilla River Basin (OR292) as part of Mountain Home Metamorphic Complex is chlorite-mica schist of Permian and (or) Tr

Unit is considered possibly correlative with the Hayfork Terrane by Irwin (1994)

Clover Creek Greenstone (OR035)Gold Creek Greenstone (OR029)

> Not present on State map (OR001) in northeastern Oregon, but, in La Grande 30' x 60' quadrangle (OR291) may be mapped as amphibolite, metagabbro, and metadiorite (Triassic and Permian)

Considered part of Rattlesnake Creek Terrane by Irwin (1994)

Most of unit is mapped as melange considered part of the Rattlesnake Creek Terrane by Irwin (1994)

(OR085)

Burnt River Schist encloses Nelson marble (unit TRPzsn), which was assigned a Elkhorn Ridge Argillite (OR035; OR126)Coyote Butte Formation Late to Middle Triassic age based on conodonts (OR191). The Burnt River Schist is intruded by a 230 Ma (Middle Triassic) diorite (OR190).

Nelson marble (OR030)

Canyon Mountain Complex (OR008; OR079; OR080)

Begg Formation (OR028)Brisbois Formation (OR028)Laycock Creek Graywacke (OR008)Murderers Creek Graywacke (OR008)Vester Formation (OR008)Rail Cabin Argillite (OR028)Fields Formation (OR008)Martin Bridge Formation (OR029; OR074)Doyle Creek Formatio

Not defined on the State map (OR001) in the northeastern Oregon, but mapped in Umatilla River Basin (OR291) as ultramafic rocks (Triassic and Permian?)

Huntington Formation (OR073)

Drewsy Formation (OR009)Rattlesnake Formation (OR008)Dalles Formation (OR010; OR011)Shutler Formation (OR012)McKay Beds (OR013; OR014; OR015)Kern Basin Formation (OR016)Rome Beds (OR017)Danforth Formation (obsolete) (OR018)Bully Creek Format

Huntington Formation (OR073) is predominantly agglomerate, tuff, and flows intercalated with coarse volcaniclastic breccia and conglomerate. Also contains volcanic graywacke, volcanic arenite, water-laid tuff, volcanic siltstone, and minor limestone. V

Also includes Chalk Butte Formation (OR016), Drip Springs Formation (OR023; OR024), sediments of Captain Keeney Pass (OR153), Glenns Ferry Formation (OR154; OR155), and part of the Grassy Mountain Basalt (OR121). In northern half Umatilla River Basin (OR

Pike Creek Formation (OR005; formerly Pike Creek Volcanic Series; OR062)

Basalt in the Pike Creek was dated at 21.9 Ma (OR010; recalculated using constants of OR185).

Unit in La Grande 30' x 60' quadrangle (OR291), reinterpreted as part of Oligocene and early Miocene Tower Mountain volcanic field with the main vent a 14-km-wide caldera (Tower Mountain caldera). Vent-filling ash-flow tuff is intruded by dacite and rh

The large area of Tstv shown on the State geologic map (OR001) northwest of Vale is a continuation of lower and middle Miocene rock units mapped to the south in the Vale 30'x 60' quadrangle (OR007) and includes rhyolite of Cottonwood Mountain, Hunter Cre

Mascall Formation (OR059)Sucker (Succor) Creek Formation (OR016; OR023; OR024)Drip Spring (OR023; OR024)Trout Creek Formation (OR060)Picture Gorge Basalt (OR061)

assorted rocks

miscellaneous ash-flow tuffs of various Tertiary ages

Westfall Butte Volcanics (OR148)Rhyolite of Star Mountain (OR149)

Dinner Creek Welded Ash-Flow Tuff (OR023; OR024; of Oregon Canyon (OR177) Tuff of Trout Creek Mountains (OR177)Tuff of Double H (OR177)Tuff of Long Ridge (OR177)Tuff of Hoppin Peaks (OR177)T

The rhyolitic domal complexes become younger toward the northwest. Includes volcanics of Westfall Butte (OR148), which contains basalt, and rhyolite of Star Mountain (OR149).

OR054; OR055; OR114; OR117) Tuff of Kern Basin (OR137) Tuff The Dinner Creek caldera source is in the Castle Peak area (OR156) or from a largely buried caldera north of Westfall Butte (OR178). Leslie Gulch Ash-Flow Tuff is associated wirth Mahogany Mountain caldera; tuff of Spring Creek, with

> In northeastern part of Ochoco Reservoir (15') quadrangle (OR302), unit includes rocks identified as parts of the John Day Formation: chiefly dacitic and rhyolitic tuff, pumice-lapilli tuff, and welded ash-flow tuff; and rhyolitic intrusive rocks locally
